
**BIOLUX RESEARCH ANNOUNCES FILING OF
PATENT APPLICATION FOR REGULATION OF
ORTHODONTIC TOOTH MOVEMENT.**

VANCOUVER, B.C., CANADA – June 24, 2010 – Biolux Research Ltd. is pleased to announce the filing of a second patent application for a method and apparatus for accelerating and regulating orthodontic tooth movement with light treatment technology. The company filed the application through the Patent Cooperation Treaty process, which will allow for expansion of patent protection to over 200 countries, including all major markets of the world.

Orthodontic treatment timelines are typically 24 months, due to the time required for the natural processes of bone resorption and bone regeneration as tooth roots move through the bone. During traditional orthodontic treatment with brackets and wires providing the mechanical forces to move the teeth, the average patient may experience discomfort and pain, as well as increased self-consciousness and change of diet. Thus there is strong interest from the patient and orthodontic community to decrease the overall treatment timeline for orthodontics, particularly in the adult orthodontics market. There are approximately 10,000 orthodontists in the US and Canada, with approximately 2.5 million patients undergoing orthodontic treatment in each year.

The Biolux technology significantly accelerates the rate of tooth movement through bone, by accelerating the biological processes of bone resorption and regeneration through the introduction of light energy directly into the tissue. The technology is non-invasive and is completely compatible with any orthodontic tooth movement system and mechanics.

“We are very pleased with our success in decreasing orthodontic treatment timelines, in expanding our intellectual property portfolio, and in increasing value for our shareholders,” states Kevin Strange, President and CEO of Biolux. “Orthodontics is a very large and growing market in dentistry, with a clear need and desire to reduce treatment timelines, and we believe we have the breakthrough innovation to revolutionize the market.”

About Biolux Research

Biolux Research Ltd. is a world leader in the development of Light Accelerated Bone Regeneration systems for dentistry. Biolux focuses on product development, clinical and basic research, and its proprietary, patent-pending OsseoPulse™ Bone Regeneration System has been developed to enhance clinical outcomes in implantology and oral surgery by accelerating implant integration and bone regeneration in a safe, effective and non-invasive approach. www.bioluxresearch.com
