VANCOUVER, B.C., CANADA – Aug 13, 2009 – Biolux Research Ltd. is pleased to announce that it has received a non-repayable financial contribution from the National Research Council of Canada Industrial Research Assistance Program (NRC-IRAP) to help accelerate the development and commercialization of a new light treatment device for orthodontics. The new product will be designed to significantly accelerate tooth movement during orthodontic treatment, and thus radically reduce treatment times and improve the experience for patients.

NRC-IRAP will contribute approximately CAD $205,000 over the next 18 months to support the research and prototyping of the device, to clinically test and validate the effectiveness of the technology, and to develop a high quality, manufacturable product. In addition to the contribution, NRC-IRAP will provide both technical and business oriented advisory services.

NRC-IRAP works with small- and medium-sized Canadian firms, providing expertise and advice as well as potential funding in developing their innovative ideas. Financial assistance for this project is a direct result of the Government of Canada’s Economic Action Plan outlined in Budget 2009.

“This financial support from the Government of Canada through NRC-IRAP is very positive for Biolux, and enables us to pursue our research and development of our new orthodontics product in a timely manner, and ultimately accelerates the commercialization of the product into the market,” states Kevin Strange, President and CEO of Biolux. “Orthodontics is a very large and important market for us, and is adjacent to the implant stability market for our initial product, the OsseoPulse™ Bone Regeneration System. There is a clear need for reducing treatment timelines for all orthodontic patients, which are typically 12 to 36 months, and we strongly believe that our technology will lead to a revolutionary approach to orthodontics.”

About Biolux Research

Biolux Research Ltd. is a world leader in the development of light activated bone regeneration systems for dentistry. Biolux focuses on product development, clinical and basic research, and its proprietary, patent-pending OsseoPulse™ Bone Regeneration System is premised on a vision to transform the practice of implantology and oral surgery in dentistry by accelerating implant integration and bone regeneration in a safe, effective and non-invasive approach. www.bioluxresearch.com
